

# Build Software Safely!

17-313 Fall 2024

Foundations of Software Engineering

<https://cmu-313.github.io>

Michael Hilton and Rohan Padhye

# Learning Goals

- Learn to discuss risk in a project
- Strategize about ways to mitigate risk
- Learn to get early feedback to reduce risk
- Find ways to catch our technical errors

2

# Administrivia

- Midterm Oct 8 in class
  - We will approve ODR requests, reach out if you have concerns
- Review Session: Friday October 4th 5-6 pm in TCS 358
- P2C - Collaborative Development Due Thu, Oct 10th, 11:59pm
- Office hour moved TO 2-3pm

# Definition: Risk

Risk is a measure of the potential inability to achieve overall program objectives within defined cost, schedule, and technical constraints.

6

# Risk is defined by two key components

**The probability (or likelihood) of failing to achieve a particular outcome**

**The consequences (or impact) of failing to achieve that outcomes**

# Internal vs. External Risk

Risks that we **can** control

Risks that we **cannot** control

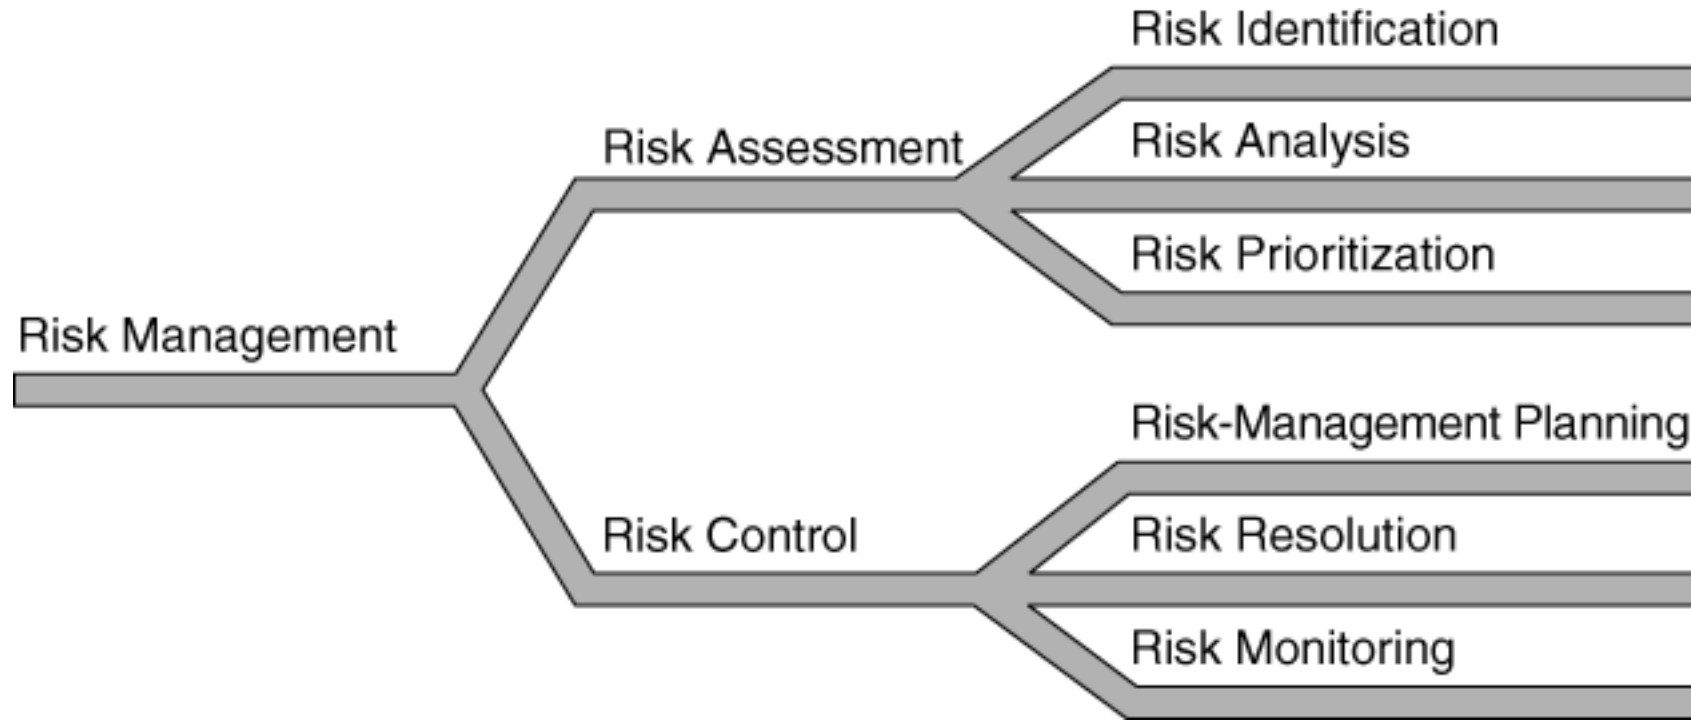

# Levels of Risk Management

1. **Crisis management:** Fire fighting; address risks only after they have become problems.
2. **Fix on failure:** Detect and react to risks quickly, but only after they have occurred.
3. **Risk mitigation:** Plan ahead of time to provide resources to cover risks if they occur, but do nothing to eliminate them in the first place.
4. **Prevention:** Implement and execute a plan as part of the software project to identify risks and prevent them from becoming problems.
5. **Elimination of root causes:** Identify and eliminate factors that make it possible for risks to exist at all.

# Levels of Risk Management

1. **Crisis management:** Fire fighting; address risks only after they have become problems.
2. **Fix on failure:** Detect and react to risks quickly, but only after they have occurred.
3. **Risk mitigation:** Plan ahead of time to provide resources to cover risks if they occur, but do nothing to eliminate them in the first place.
4. **Prevention:** Implement and execute a plan as part of the software project to identify risks and prevent them from becoming problems.
5. **Elimination of root causes:** Identify and eliminate factors that make it possible for risks to exist at all.

14

# Risk assessment matrix

TABLE III. Risk assessment matrix

RISK ASSESSMENT MATRIX				
SEVERITY \ PROBABILITY	Catastrophic (1)	Critical (2)	Marginal (3)	Negligible (4)
Frequent (A)	High	High	Serious	Medium
Probable (B)	High	High	Serious	Medium
Occasional (C)	High	Serious	Medium	Low
Remote (D)	Serious	Medium	Medium	Low
Improbable (E)	Medium	Medium	Medium	Low
Eliminated (F)	Eliminated			

• MIL-STD-882E

<https://www.system-safety.org/Documents/MIL-STD-882E.pdf>

# Aviation failure impact categories

- **No effect** – failure has no impact on safety, aircraft operation, or crew workload
- **Minor** – failure is noticeable, causing passenger inconvenience or flight plan change
- **Major** – failure is significant, causing passenger discomfort and slight workload increase
- **Hazardous** – high workload, serious or fatal injuries
- **Catastrophic** – loss of critical function to safely fly and land

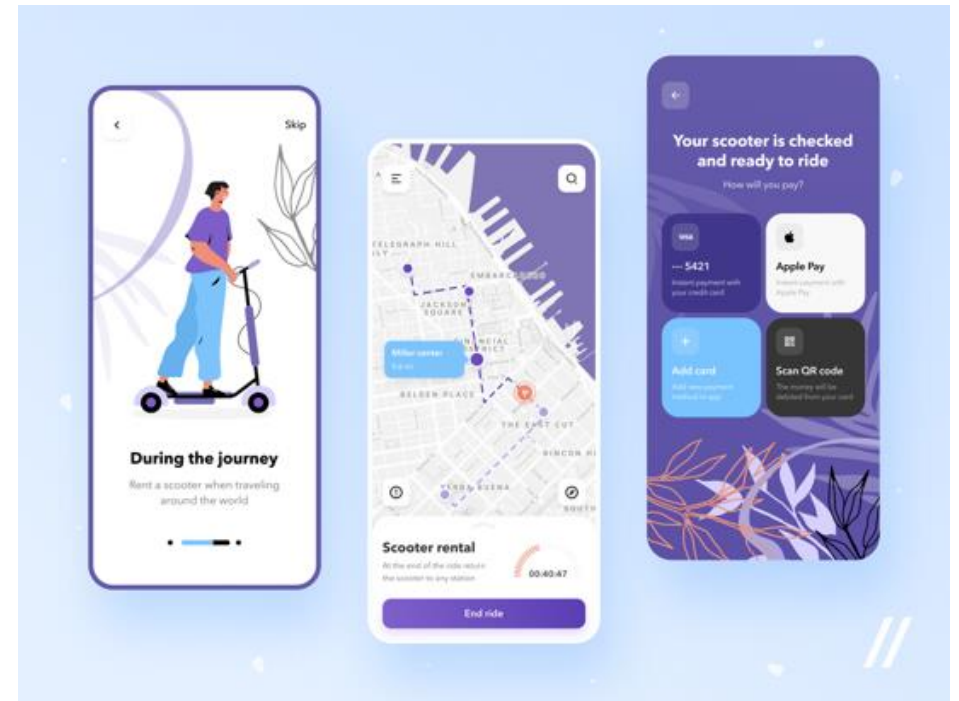

# Risk Analysis

Risk	Probability (%)	Size of Loss (weeks)	Risk Exposure (weeks)
Overly optimistic schedule	50%	5	2.5
Additional features added by marketing (specific features unknown)	35%	8	2.8
Project approval takes longer than expected	25%	4	1.0
Management-level progress reporting takes more developer time than expected	10%	1	0.1
New programming tools do not produce the promised savings	30%	5	1.5
...	...	...	...
<b>Total</b>			<b>12</b>

# Exercise: Risk Analysis

- What is the risk severity for your scooter app?

# Risk Prioritization

Focus on risks with the highest exposure

19

# Risk Control

- What steps can be taken to avoid or mitigate the risk?
- Can you better understand and forecast the risk?
- Who will be responsible for monitoring and addressing the risk?
- Have risks evolved over time?
- Bake risks into your schedule
  - Don't assume that nothing will go wrong between now and the end of the semester!

20

# DECIDE Model

**Detect** that the action necessary

**Estimate** the significance of the action

**Choose** a desirable outcome

**Identify** actions needed in order to achieve  
the chosen option

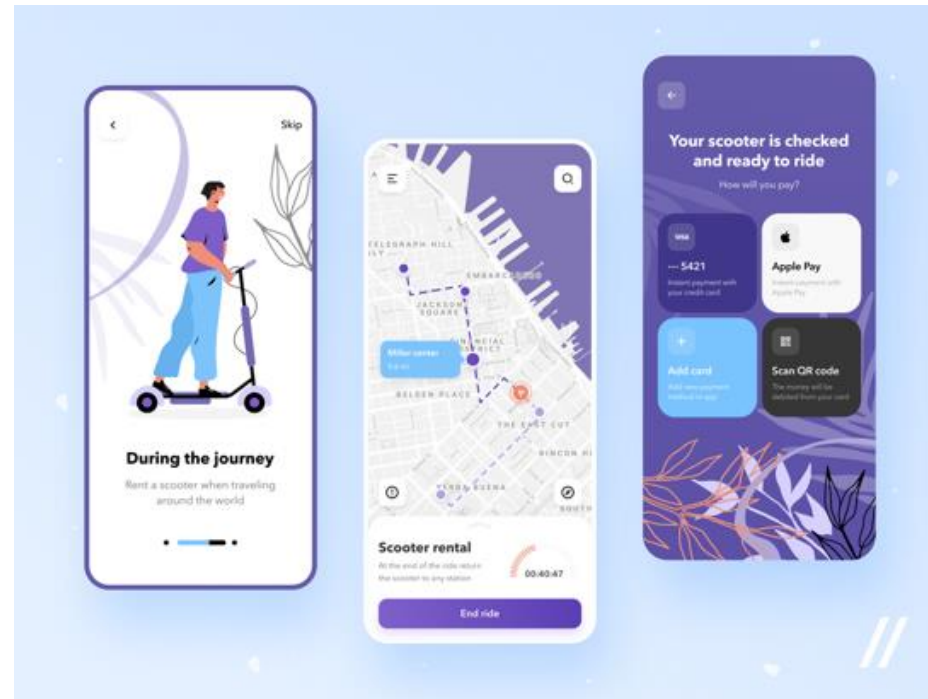

**Do** the necessary action to achieve change

**Evaluate** the effects of the action

Boredom can give rise to errors, adverse patient events, and decreased productivity—costly and unnecessary outcomes for consumers, employees, and organizations alike. As a function of boredom, individuals may feel over-worked or under-employed, and become distracted, stressed, or disillusioned. Staff who are bored also are less likely to engage with or focus on their work.

### Abstract

**Boredom in the workplace is not uncommon, and has been discussed widely in the academic literature in relation to the associated costs to individuals and organizations. Boredom can give rise to errors, adverse patient events, and decreased productivity—costly and unnecessary outcomes for consumers, employees, and organizations alike. As a function of boredom, individuals may**

# CI can run static and dynamic analysis

The screenshot displays a GitHub pull request interface. At the top left, there is a green icon with a white branching diagram. The main content area is a light gray box with a green border. It features a header section with a pull request icon, the title "Require approval from specific reviewers before merging", a description "Rulesets ensure specific people approve pull requests before they're merged.", and an "Add rule" button with a close icon. Below this is a summary section with a green checkmark, the text "All checks have passed", and "11 successful checks", with a "Hide all checks" link. The core of the interface is a list of six CI checks, each with a green checkmark, a GitHub logo, a title, a status, and a "Details" link. The checks are: "Homework 1 Check / Homework 1 (ubuntu-latest, 16) (pull\_request) Successful in 1m", "Lint / Lint (ubuntu-latest, 16) (pull\_request) Successful in 3m", "Test / Test (ubuntu-latest, 16, mongo-dev) (pull\_request) Successful in 6m", "Test / Test (ubuntu-latest, 16, mongo) (pull\_request) Successful in 5m", "Test / Test (ubuntu-latest, 16, redis) (pull\_request) Successful in 5m", and "Test / Test (ubuntu-latest, 16, postgres) (pull\_request) Successful in 6m". At the bottom, there is a green "Merge pull request" button with a dropdown arrow, followed by the text "You can also [open this in GitHub Desktop](#) or view [command line instructions](#)."

The Checklist: <https://www.newyorker.com/magazine/2007/12/10/the-checklist>

# Dr. Peter Pronovost

- Inspired by B-17 Story
- After checklist, ten-day line-infection rate went from eleven per cent to zero
- In 15 months, only two line infections occurred
- For one hospital, the checklist had prevented forty-three infections and eight deaths, and saved \$2M

## The Pronovost Checklist

Central venous catheters, or lines, are used for medications, blood, fluids or nutrition and can stay in for days or weeks. But bacteria can grow in the line and spread a type of infection to the bloodstream, which causes death in one out five patients who contract it. This five-step checklist for doctors and nurses to use before inserting a line can prevent infections and death.

1. **Wash hands** with soap and water or an alcohol cleanser
2. **Wear sterile clothing**—a mask, gloves, and hair covering—and cover patient with a sterile drape, except for a very small hole where the line goes in
3. **Clean patient's skin** with chlorhexidine (a type of soap) when the line is put in
4. **Avoid veins in arm and leg**, which are more likely to get infected than veins in chest
5. **Check the line for infection** each day and remove when no longer needed

# Difference between Pilot and Doctor error?

Which is Developer error more like?

# How to create a checklist?

- Start with problems we have seen before
  - “Safety regulations are written in blood”
- Justify why this is not automatable
- Not all checklist items need to be very specific
  - An item could be “does this team know we are proposing this change”

# Activity: Create a checklist

- In pairs, think about dumb mistakes your “friend” made the last time they were coding.
  - Write your names on a piece of paper.
  - Write down two checklist items that would have caught those errors.
- Divide into teams: left and right sides of the classroom.
- Which team had the most unique/good entries in their list?

# Expectations and Outcomes for code review

# Motivation

- Linus's Law: "Given enough eyeballs, all bugs are shallow."
  - - The Cathedral and the Bazaar, Eric Raymond

# Code Review at Microsoft

Bacchelli, Alberto and Christian Bird. "Expectations, outcomes, and challenges of modern code review." Proceedings of the 2013 International Conference on Software Engineering. IEEE Press, 2013.

# Outcomes (Analyzing Reviews)

# Mismatch of Expectations and Outcomes

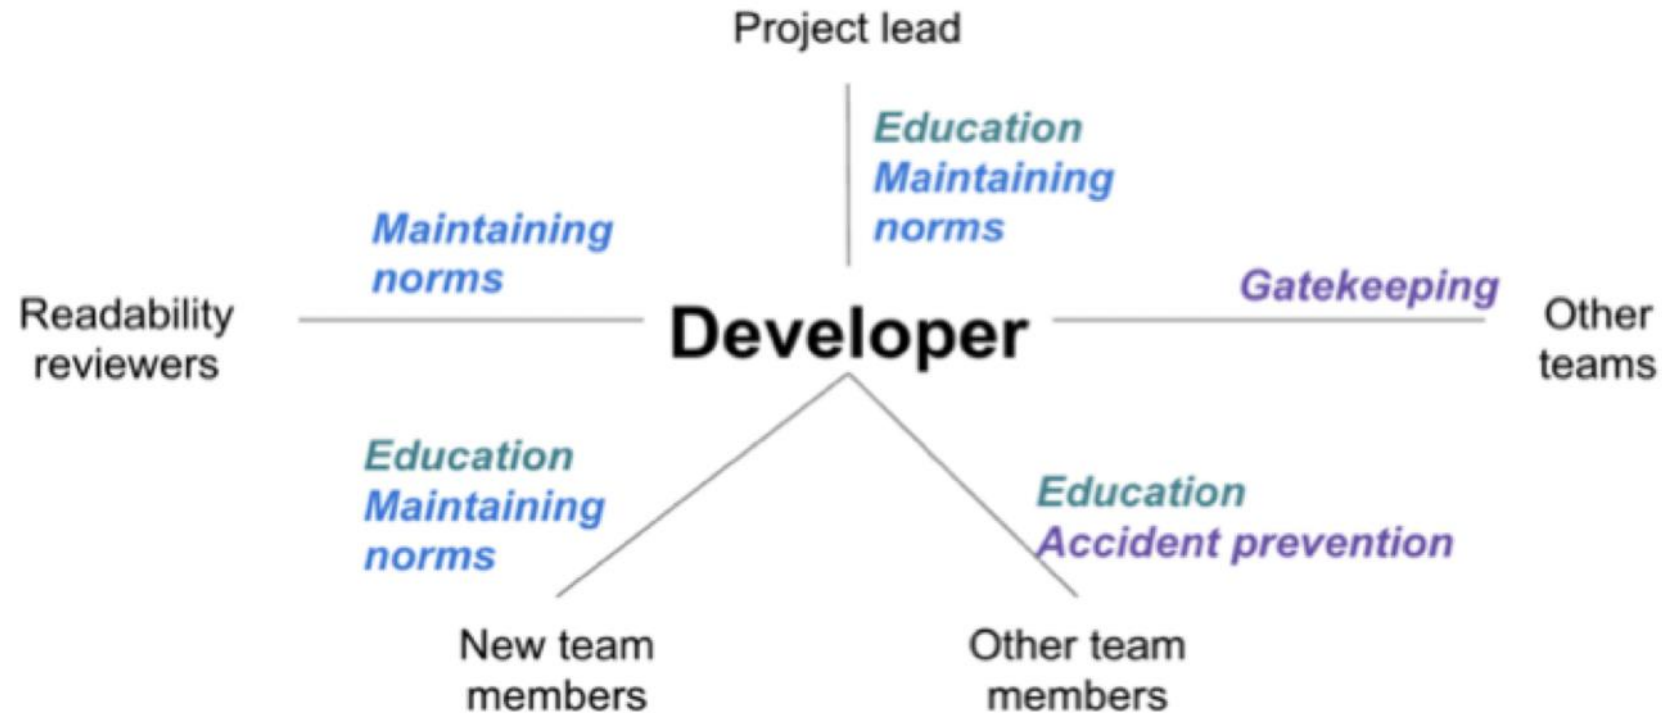

- Low quality of code reviews
  - Reviewers look for easy errors, as formatting issues
  - Miss serious errors
- Understanding is the main challenge
  - Understanding the reason for a change
  - Understanding the code and its context
  - Feedback channels to ask questions often needed
- No quality assurance on the outcome

# Code Review at Google

- Introduced to “force developers to write code that other developers could understand”
- Three benefits:
  - checking the consistency of style and design
  - ensuring adequate tests
  - improving security by making sure no single developer could commit arbitrary code without oversight

Caitlin Sadowski, Emma Söderberg, Luke Church, Michal Sipko, and Alberto Bacchelli. 2018. Modern Code Review: A Case Study at Google. International Conference on Software Engineering

# Reviewing Relationships

# The State of Code Review survey

What do you believe are the most important benefits of code review?

n = 1129

# Code Review

- Start with the “big ideas”
- Automate the little things
- Focus on understanding
- Remember a person wrote the code
- Don't overwhelm the person with feedback

# Don't forget that coders are people with feelings

- A coder's self-worth is in their artifacts
- CI can avoid embarrassment
- Identify defects, not alternatives; do not criticize coder
  - “*you* didn't initialize variable a” -> “I don't see where variable a is initialized”
- Avoid defending code; avoid discussions of solutions/alternatives
- Reviewers should not “show off” that they are better/smarter
- Avoid style discussions if there are no guidelines
- The coder gets to decide how to resolve fault

# Risk Analysis:

- Probability a human makes a mistake: Very Likely
- Severity: ranges, but could be extensive

Solution:

Use CI to catch your mistakes, make you look better, and mitigate your risks!

Use Code review to teach and learn
